ABSTRACT OF THE DISCLOSURE

A computer user interface system and method arranges a set of information hosted on a computer into a set of books, where each book includes a subset of the set of information, labels each book with a respective portion of the subset of the set of information, and selects a book from the set of books. Selecting the book from the set of books includes steps of displaying the respective portions of the books as a book document image that includes pages which correspond to the respective portions of the books, generating a command for moving through the pages, displaying an animated image of the pages of the book document being at least one of flipped, scrolled, slid and flashed images, and selecting the book when a selected one of the pages containing a selection portion of the book is earlier displayed.
